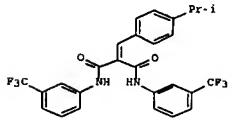
I



II

AB Substituted 2-arylmethylene-N-aryl-N'-aryl-malonamides and analogs I [wherein Ar1, Ar2, Ar3 = independently (un)substituted hetero/aryl, hetero/arylalkyl, (partially) saturated carbocyclic, heterocyclic] were prepared as activators of caspases and inducers of apoptosis for treating neoplasm. For example, II was prepared by acylation of with 3-aminobenzotrifluoride malonyl dichloride and reaction of the diamide with 4- isopropylbenzaldehyde. II exhibited caspase activation (EC50 = 15 nM for human breast cancer cell line T-47D), inhibition of cell proliferation (GI50 = 180 nM for T-47D). II induced apoptosis in Jurkat and T-47D cells. I can be used to induce cell death in a variety of clin. conditions in which uncontrolled growth and spread of abnormal cells occure.

AB Title compds. I [wherein A = 5-membered aromatic heterocycle containing 2 or more nitrogens, which may further have substituent(s); B = (un)substituted hydrocarbyl, heterocyclyl; X = divalent acyclic hydrocarbon group; Z = O, S, NR2, CONR2, or NR2CO; R2 = H, (un)substituted alkyl; Y = a bond or a divalent acyclic hydrocarbon group; R1 = (un)substituted cyclyl, amino, acyl, provided that when A = imidazole, Z should not be O; and their salts] were prepared as production/secretion promoters of neurotrophic factors, in particular glial-derived GDNF, for preventing or treating neuropathy having superior action and low toxicity. For example, reacting acid II with oxalyl chloride, followed by acylation of 4-(1H-imidazol-1- ylmethyl)aniline with the in-situ formed acid chloride gave the pyrazolylacrylamide III. Selected I displayed an EC50 in the range of 0.12 to 1.00 μm/l using rat C6 glioma cells, demonstrating their GDNF production promoting action. Selected I showed promoted formation of neurite network under a microscope, demonstrating their neuroprotective action.

AB Condensation of 3-aryl(heteryl)-4-formylpyrazoles with malonic acid gives 3-[3-aryl(heteryl)- pyrazol-4-yl]propenoic acids that in the presence of Raney nickel are reduced by hydrazine hydrate to 3-[3-aryl(heteryl)pyrazol- 4-yl]propanoic acids. The successive conversion of both type acids into the corresponding acyl chlorides, esters, and amides was performed.
IT 519137-64-5P
RL: SPN (Synthetic preparation); PREP (Preparation)
(preparation of substituted aryl(heteryl)pyrazolylpropenoic and propanoic acids via condensation of arylheterylformylpyrazoles with malonic acid followed by Raney reduction and conversions to acyl, ester, and amide derivs.)

AB 4-Formyl-2-pyrazolin-5-ones were condensed with hippuric acid derivs. to give the corresponding pyrazolylmethylene azalactones which were reacted with Grignard reagents to give the corresponding tertiary alcs. Aminolysis of oxazolones with aromatic amines in boiling ethanol yielded acrylamides. Structural assignments of the new products were based on elemental anal. and IR, PMR spectral data.

DOCUMENT TYPE:            Journal
LANGUAGE:                 English
AB    The present study was designed to clarify an intensity-dependent effect of
      prenatal stress on the morphol. development of hippocampal neurons in rats.
      In addition, the involvement of receptors for glucocorticoids, i.e.
      mineralocorticoid receptors and glucocorticoid receptors, in stress-induced
      changes in the morphol. of hippocampal neurons was examined by an in vitro
      pharmacol. approach. The effects of mild prenatal stress on neurogenesis and
      long-term potentiation in the hippocampus were also investigated in adult
      offspring. Prenatal stress affected the morphol. development of the
      hippocampus in an intensity-dependent manner. Short-lasting, mild prenatal
      stress enhanced neonatal neurogenesis and differentiation of processes of
      hippocampal neurons, whereas long-lasting, severe stress impaired their
      morphol. Mineralocorticoid receptor was found to mediate enhancement of
      neurogenesis and differentiation of processes of cultured hippocampal neurons.
      In contrast, glucocorticoid receptor was involved in the suppression of their
      morphol. Short-lasting, mild prenatal stress, which has previously been shown
      to enhance learning performance in adult offspring, facilitated neurogenesis
      and long-term potentiation in the adult hippocampus. These findings suggest
      that prenatal stress has enhancing and suppressing effects on the development
      of hippocampal neurons depending on intensity, and that mineralocorticoid
      receptors and glucocorticoid receptors contribute to stress-induced morphol.
      changes.

AB 1,2-Azole derivs. A-B-Xa-Ya-Xb-Yb-C-Xc-Yc-C(:O)-R (I; e.g. II) wherein ring A optionally has 1-3 substituents; ring B is a 1,2-azole ring which may further have 1 to 3 substituents; Xa, Xb and Xc are the same or different and each is a bond, -O-, -S- and the like; Ya is a divalent aliphatic hydrocarbon residue having 1-20 C atoms; Yb and Yc are the same or different and each is a bond or a divalent aliphatic hydrocarbon residue having 1-20 C atoms; ring C is a monocyclic aromatic ring which may further have 1 to 3 substituents; and R = -OR4 (R4 is H atom or (un)substituted hydrocarbon group) and the like, or a salt thereof or a prodrug thereof is useful as an agent for the prophylaxis or treatment of diabetes and the like. Hypoglycemic and hypolipidemic actions in mice are tabulated for about 50 examples of I; e.g. a 53 % rate of decrease in blood glucose level in the presence of 0.005 % [2-[3-[3-isopropyl-1-[5-(trifluoromethyl)- 2-pyridinyl]-1H-pyrazol-4-yl]propoxy]-3-methylphenyl]acetic acid and a 77 % rate of decrease in blood triglyceride level in the presence of 0.005 % 2-methyl-2-[4-[3-methyl-1-[5-(trifluoromethyl)-2-pyridyl]-1H-pyrazol-4-ylmethoxy]phenoxy]propionic acid when the level (glucose or triglyceride) of the non-treated group is taken as 100 %. Plasma anti-arteriosclerosis index-enhancing action in mice is tabulated for 34 examples of I, e.g. 25 % for [3-methoxy-2-[3-[3-propyl-1-[5- (trifluoromethyl)-2-pyridyl]-1H-pyrazol-4- yl]propoxy]phenyl]acetic acid. PPARγ-RXRα and PPARδ-RXRα heterodimer ligand activity is tabulated for 59 and 80 examples, resp., of I, e.g. EC50 = 3.8 nM for PPARγ-RXRα for [2-[3-[3-cyclohexyl-1-[5-(trifluoromethyl)-2-pyridinyl]-1H- pyrazol-4-yl]propoxy]-3-methylphenyl]acetic acid. Nearly 400 example prepns. of I and 351 example prepns. of intermediates are included. For example, [4-[3-[3-[4-(trifluoromethyl)phenyl]-5- isoxazolyl]propoxy]phenyl]acetic acid was obtained in 25 % yield from a mixture of 3-[3-[4-(trifluoromethyl)phenyl]-5-

isoxazolyl]-1-Pr methanesulfonate, NaI, Me 2-(4-hydroxyphenyl)acetate, K2CO3 and DMF; details of the preparation of the mesylate are also given.

AB Carbon monoxide (CO) is the most popular cause of poisoning. The bilateral basal ganglia lesion characterizes the delayed neuronal cell death (DCD). We demonstrated there were both apoptosis and necrosis in the cortex, basal ganglia and hippocampus in a case of human CO accident. To elucidate the mechanism of DCD after CO inhalation, histol. studies on the rat brain were conducted. Rats were ventilated with nitrous oxide (sham group), 10% O2 (hypoxia group) or 1005 ppm CO (CO group) for 90 min, while the pericranial temperature was controlled at either 32, 37, or 39° during CO inhalation. After reoxygenation for 30 min, the rats were allowed to recover for 48 h. The ratio of eosinophilic and HNE-pos. neurons in the cortex were higher in the CO group than in the hypoxia group at 37°, while the PaO2 was much lower in the hypoxia than in the CO group. The damage was alleviated in the hypothermia (32°) as compared with normothermia, while the hyperthermia (39°) did not significantly increased it. CO inhalation injures neuron by reactive oxygen species (ROS), independent of hypoxia, as can be concluded from the histol. comparison of DCD with HNE immunoreactivity.

AB A novel series of 5-(ω-aryloxyalkyl)oxazole derivs. was prepared and their effects on brain-derived neurotrophic factor (BDNF) production were evaluated in human neuroblastoma (SK-N-SH) cells. Syntheses were performed by construction of an oxazole ring as a key reaction. Most of the 5-(ω-aryloxyalkyl)oxazole derivs. markedly increased BDNF production in SK-N-SH cells. 4-(4-Chlorophenyl)-2-(2-methyl-1H- imidazol-1-yl)-5-[3-(2-methoxyphenoxy)propyl]-1,3-oxazole, one of the most promising compds., showed potent activity (EC50=7.9 μM) and the improvement of the motor nerve conduction velocity and the tail-flick response accompanied by a recovery of the brain-derived neurotrophic factor level in the sciatic nerve of streptozotocin (STZ)-diabetic rats.

AB Most studies on hormonally active agents or endocrine disruptors have been limited to polychlorinated biphenyls and dioxins. In this paper, we report results of in vitro studies on the effects of alkylphenolic compds., namely, n-pentylphenol, n-hexylphenol, n-heptylphenol, n-octylphenol, and n-nonylphenol, on the injury rate, survival, and acetylcholinesterase activity of the rat pheochromocytoma cell line PC12. Results using the lactate dehydrogenase cytotoxicity assay to determine cell injury rate reveal that the alkylphenols mentioned did not induce cell necrosis beyond 30%, even at concns. as high as 300 μM in a 15-min incubation period. Exposing the cells to alkylphenols for 4 h and testing for DNA fragmentation showed that nonylphenol and octylphenol also did not induce apoptosis, even at concns. as high as 500 and 100 μM, resp. However, incubating the cells with the alkylphenols for 24 h significantly inhibited acetylcholinesterase activity at

concns. as low as 0.8 μM, with n-octylphenol showing the most significant effect. Since it is believed that human exposure to nonylphenol from drinking water is around 0.7 μg / day and that these compds. can accumulate in adipose tissue, this finding may implicate alkylphenols in neurol. and behavioral disturbances in both animals and humans.

AB To assess the itch-associated response of primary afferents innervating the murine skin in vivo, dose-response curves and time-courses for itch-scratching and cutaneous nerve firing responses to intradermal injections of pruritogens (histamine and serotonin) were compared in ICR and ddY mice. Histamine increased itch-scratch response and cutaneous nerve firing in ICR, but not ddY, mice. Serotonin increased these two responses in either ICR or ddY mice.

The dose-response curves and time-courses for histamine- and serotonin-induced nerve firing were similar to those for the itch-scratch response. The results suggest that histamine does not necessarily act as a pruritogen in mice, and raise the possibility that strain difference in the pruritogenic action of histamine is at least partly due to the difference in responsiveness of cutaneous nerve to this biogenic amine.

AB Described are preventives or remedies for diabetes containing compds. of the general formula (I) or their salts or prodrugs thereof [wherein one of R1 and R2 is hydrogen or a substituent and the other is an optionally substituted cyclic group; W is a free valency or a divalent aliphatic hydrocarbon group; and Y is a group represented by the general formula OR3 (wherein R3 is hydrogen, optionally substituted hydrocarbyl, an optionally substituted heterocyclic group, or optionally substituted acyl) or carboxyl which may be converted into an ester or an amide]. These compds. have excellent insulin secretion-promoting and blood sugar-decreasing effects and low toxicity and are useful as drugs, particularly preventive and therapeutic agents for diabetes and diabetic complication. Thus, reduction of 3-[5-(3,4-dichlorophenyl)-4-isoxazolyl]propionic acid Me ester (preparation given) by diisobutylaluminum hydride in hexane/THF at room temperature for 1 h gave 97% 3-[5-(3,4-chlorophenyl)-4-isoxazolyl]propanol (II); II at 30 mg/kg p.o. was administered to rats and after 60 min, the rats were fed with glucose at 2 g/kg p.o. After 30 min, the blood sample was taken and the blood sugar level measured was 75% of the control. A capsule and tablet formulation containing II were formulated.

AB 5-(ω-Azolylalkoxyphenylalkyl)-2,4-thiazolidinones and -2,4-oxazolidinones such as furylmethyloxazolylmethoxymethoxyphenylpropyl oxazolidinedione I were prepared as potential antidiabetic and antihyperlipidemic agents. Many of the 2,4-thiazolidinediones and 2,4-oxazolidinones showed potent glucose- and lipid-lowering activities. The antidiabetic activities of the 2,4-oxazolidinediones were superior to those of the 2,4-thiazolidinediones. Both enantiomers of I, one of the most interesting compds. in terms of activity, were synthesized by using an asym. O-acetylation of the corresponding α-hydroxyvalerate with immobilized lipase, followed by cyclization of the oxazolidinedione ring. The (R)-(+)-enantiomer of I showed more potent glucose-lowering activity [ED25 = 0.561 mg/kg/d] than either the (S)-(-)-enantiomer (ED25 > 1.5 mg/kg/d) or pioglitazone (ED25 = 6 mg/kg/d) in KKAy mice. (+)-(R)-I also exhibited a 10-fold more potent antidiabetic activity (ED25 = 0.05 mg/kg/d) than pioglitazone (ED25 = 0.5 mg/kg/d) in Wistar fatty rats. The antidiabetic effects of I are related to its activity as a potent agonist for peroxisome proliferator-activated receptor γ (PPAR-γ) (EC50 = 6.87 nM). The crystal structures of intermediates in the synthesis of nonracemic thiazolidinediones were determined by X-ray crystallog.

AB Most studies on hormonally active agents or endocrine disrupters were limited to polychlorinated biphenyls and dioxins. In this paper, we report results of in vitro studies on the effects of alkylphenolic compds., namely, n-pentylphenol, n-hexylphenol, n-heptylphenol, n-octylphenol, and n-nonylphenol, on the injury rate, survival, and acetylcholinesterase activity of the rat pheochromocytoma cell line PC12. Results using the lactate dehydrogenase cytotoxicity assay to determine cell injury rate reveal that the alkylphenols mentioned did not induce cell necrosis beyond 30%, even at concns. as high as 300 μM in a 15-min incubation period. Exposing the cells to alkylphenols for 4 h and testing for DNA fragmentation showed that nonylphenol and octylphenol also did not induce apoptosis, even at concns. as high as 500 and 100 μM, resp. However, incubating the cells with the alkylphenols for 24 h significantly inhibited acetylcholinesterase activity at concns. as low as 0.8 μM, with n-octylphenol showing the most significant effect. Since it is believed that human exposure to nonylphenol from drinking water is around 0.7 μg day-1 and that these compds. can accumulate in adipose tissue, this finding may implicate alkylphenols in neurol. and behavioral disturbances in both animals and humans.

I

AB A series of 5-(4-alkoxyphenylalkyl)-1H-tetrazole derive. containing an oxazole-based group at the alkoxy moiety was prepared; the antidiabetic and antihyperlipidemic effects of members of the series were evaluated in two genetically obese and diabetic animal models. The tetrazole compds. were prepared using the cycloaddn. of azides with the correspondng nitriles. Many of the 5-(4-alkoxyphenylalkyl)-1H-tetrazoles showed potent glucose and lipid lowering activities in KKAy mice. Methylphenyloxazolylmethoxypy ridylpropyltetrazole I had potent glucose lowering activity (ED25 = 0.0839 mg·kg-1·d-1), being 72 times more active than pioglitazone hydrochloride (ED25 = 6.0 mg·kg-d-1); in addition, I also exhibited strong antihyperlipidemic activity (ED25 = 0.0277 mg·kg-1·d-1) in Wistar fatty rats. The antidiabetic activity of I is likely related to its potent agonistic activity for peroxisome proliferator-activated receptor γ (PPARγ) (EC50 = 6.75 nM).

AB The authors reported previously that 7-hydroperoxycholesterols, 7α- and 7β-hydroperoxycholest-5-en-3β-ol (7α-OOH and 7β-OOH), indicated lipid peroxidn. (2000). In the present study, the authors measured not only 7-hydroperoxycholesterols but also oxysterols (7α- and 7β-hydroxycholesterol, 7α-OH, and 7β-OH) and 3β-hydroxycholest-5-en-7-one (7-keto) in the brains of rats that underwent either a sham operation (control), hypoxia, or CO inhalation (1005 ppm) at 37° for 90 min followed by 48 h of recovery. The levels of 7-hydroperoxycholesterols, 7β-OH, and 7-keto were low in the hypoxia group, while the levels were unaltered in the CO group compared with the controls. Among the three groups of CO inhalation, these levels were high in the hyperthermia group (39°), and the 7-hydroperoxycholesterols were low in the hypothermia group (32°), compared with the control group. The blood O2 saturation was almost normal in the hypothermia group, while it was similarly low in the hyperthermia and normothermia groups. The temperature-dependent lipid peroxidn. in the brain after CO inhalation and recovery can not be explained by hypoxia due to CO-Hb formation, but may contribute to the delayed neuronal death following CO inhalation. Hypothermia may be applicable to treat patients after CO inhalation.

AB Background-During myocardial ischemia, massive norepinephrine (NE) is released from the cardiac sympathetic nerve terminals, reflecting the sympathetic nerve injury. A brief preceding ischemia can reduce infarct size; this is known as ischemic preconditioning (PC). The effect of PC on sympathetic nerves, however, including its underlying mechanisms in dog hearts, has remained unclear. Thus, this study was designed to elucidate whether the activation of ATP-sensitive potassium (KA) channels is involved in the mechanism of cardiac sympathetic nerve protection conferred by PC. Methods and Results-Interstitial NE concentration was measured by the in situ cardiac microdialysis method in 45 anesthetized dogs. Five minutes of ischemia followed by 5 min of reperfusion was performed as PC. In the controls, the dialyzate NE concentration (dNE) increased 15-fold after the 40-min ischemia. PC decreased dNE at 40-min ischemia by 59% (P<0.01), which was reversed by glibenclamide. A KATP channel opener, nicorandil (25 μg·kg-1·min-1 IV), decreased dNE at 40 min of ischemia by 76% (P<0.01), which was also reversed

by glibenclamide. During the PC procedure, no significant increase in dNE was detected, even with the uptake-1 inhibitor desipramine. Conclusions-Cardiac sympathetic nerve injury during myocardial ischemia was attenuated by PC via the activation of KATP channels, but the trigger of the PC effect is unlikely to be NE release in dog hearts.

AB Title compds. (I) [wherein R1 = (un)substituted hydrocarbon or heterocycle; X = bond, O, S, CO, CS, CR4(OR5), or NR6; R4 and R6 = independently H or (un)substituted hydrocarbon; R5 = H or hydroxyl protective group; m = 0-3; Y = O, S, SO, SO2, NR7, CONR7, or NR7CO; R7 = H or (un)substituted hydrocarbon; A = (un)substituted aromatic ring; n = 1-8; B = (un)substituted N-containing 5-membered heterocycle; X1 = bond, O, S, SO, SO2, OSO2, or NR16; R16 = H or (un)substituted hydrocarbon; R2 = H or (un)substituted hydrocarbon or heterocycle; W = bond or hydrocarbon; R3 = OR8 or NR9R10; R8 = H or (un)substituted hydrocarbon; R9 and R10 = independently H or (un)substituted hydrocarbon or heterocycle; or R9 and R10 together with the N to which they are attached may form a ring] were prepared as retinoid-related receptor function regulating agents or insulin resistance improving agents. For example, Et 3-[1-(4-hydroxybenzyl)-4- phenyl-3-pyrrolyl]propionate and 4-chloromethyl-5-methyl-2-(2- thienyl)oxazole were coupled in the presence of K2CO3 in DMF and treated with HCl to give II (77%). At a concentration of 0.001%, II reduced hypoglycemic and hypolipidemic action by 48% and 70%, resp., lowered total cholesterol by 16%, and increased the plasma anti-arteriosclerosis index by 12% compared to non-treatment groups of mice. In addition, II showed potent PPARγ-RXRα heterodimer ligand activity with EC50 of 1.5 nM. I are useful for the prevention or treatment of diabetes mellitus, hyperlipidamia, impaired glucose tolerance, inflammatory diseases, and arteriosclerosis.

AB To measure cerebrospinal fluid and plasma concns. of nitrate and nitrite as indicators of nitric oxide production in adults after subarachnoid hemorrhage (SAH). A prospective, clin. study. Multidisciplinary intensive care unit. Nine patients (three males and six females, aged 29-64 yrs) with aneurysm-induced SAH were studied. Glasgow Coma Scale score on admission ranged from 9 to 15. Ruptured aneurysms were clipped within 72 h of ictus, and then conventional hypervolemic, hemodilution, and induced hypertension methods were applied. None. Nitrate and nitrite concns. of patients were examined sequentially by a capillary zone electrophoresis every day for 13 days. As a control group, cerebrospinal fluid was sampled from patients (n = 9, six males and three females, aged 30-60 yrs) without neurol. disorders who underwent spinal taps for spinal anesthesia, and plasma from healthy human volunteers (n = 43, 21 males and 22 females, aged 23-49 yrs). There were no significant differences over time in cerebrospinal fluid nitrate concns. after SAH. Concns. of cerebrospinal fluid nitrate after SAH were increased compared with control values. Plasma nitrate concentration was decreased compared with control values, but the value on day 14 was increased significantly ($p < .05$) compared with those during days 2-11. Plasma and cerebrospinal fluid nitrite concns. after SAH were similar to those in control subjects. Similar concns. of nitric oxide metabolite in plasma and cerebrospinal fluid were observed between the patients with and without symptomatic vasospasm. The increase of cerebrospinal fluid nitrate after SAH may attribute to the endogenous nitric oxide production in the injured brain.

AB CREB-binding protein (CBP) is a transcriptional co-activator which is required by many transcription factors. Rubinstein-Taybi syndrome (RTS), which is an autosomal dominant syndrome characterized by abnormal pattern formation, is associated with mutations in the human CBP gene. Various abnormalities occur

at high frequency in the skeletal system of heterozygous Cbp-deficient mice, but some features of RTS such as cardiac anomalies do not, suggesting that some symptoms of RTS are caused by a dominant-neg. mechanism. Here the authors report the characterization of homozygous Cbp-deficient mice. Homozygous mutants died around E10.5-E12.5, apparently as a result of massive hemorrhage caused by defective blood vessel formation in the central nervous system, and exhibited apparent developmental retardation as well as delays in both primitive and definitive hematopoiesis. Cbp-deficient embryos exhibited defective neural tube closure which was similar to those observed in twist-deficient embryos. However, a decrease in the level of twist expression was not observed in Cbp-deficient embryos. Anomalous heart formation, a feature of RTS patients and mice mutated in the CBP-related mol., p300, was not observed in Cbp-deficient embryos. Since both Cbp and p300 are ubiquitously expressed in embryonic tissues including the developing heart, these results suggest that cardiac anomalies observed in RTS patients may be caused by a dominant neg. effect of mutant CBP.

AB To test the hypothesis that glutamate excitotoxicity may play a role in hyperthermia-induced central nervous system injury, the authors measured the extracellular glutamate concns., using intracerebral microdialysis, in the rat brain following localized hyperthermia. The glutamate concentration in the dialyzate was not increased by mild hyperthermia (41°), but it reached 250% of the control level 40 min after a 20-min period of moderate hyperthermia (43°) and then decreased rapidly. When severe hyperthermia (45°) was induced, the glutamate concentration reached .apprx.300% of the control level and was maintained at that level for 100 min after hyperthermia cessation. The elevated extracellular glutamate concns. by local hyperthermia reached neurotoxic levels. Thus, a glutamate-mediated, excitotoxic process may play an important role in hyperthermia-induced cellular injury in the central nervous system.

AB Effects of bifemelane HCl (BIF) on memory function and catecholamine, glutamate, and ACh synaptic transmission following 10 min-forebrain ischemia were studied in rats. Ischemia was induced by a combination of bilateral carotid artery occlusion and hemorrhagic hypotension (50 mmHg). Either saline (non-treated group) or BIF (10 mg/kg, i.p.: BIF group) was given prior to inducing ischemia. Memory function measured by conditioned avoidance response was decreased to 30.apprx.50% for 7 days in nontreated group while it did not change in BIF group (70.apprx.80%). At the 7th day following ischemia, the brain samples were taken for the measurements of both catecholamine levels (NA and DA) and in vitro receptor autoradiog. (Glu:3H-L-Glu and mACh:3H-QNB). The DA level was decreased in striatum in BIF group. The decreased binding sites of 3H-Glu and/or 3H-QNB in septum and hippocampus in the BIF group were less severe than those in the non-treated group. These results indicate that BIF ameliorates memory impairment related to neurotransmitter derangements (Glu and ACh) following transient brain ischemia.

AB Using the 2-[14C]deoxyglucose method, the effects of analgesic doses of epidural bupivacaine (300 μg) on local spinal cord glucose utilization (SP-LGU) of the cervical, thoracic, and lumbar regions and local cerebral glucose utilization (BR-LGU) in 38 brain structures were examined in conscious rats. The effects of i.m. bupivacaine (300 μg) and the spinal cord transection (T2) were also examined to determine whether the induced metabolic changes are related to the drug systemic effect and/or deafferentation. Lumbar epidural bupivacaine sufficient to produce analgesia decreased SP-LGU in the thoracic (18-28%) and lumbar (21-29%) spinal cord but not in the cervical cord. Epidural bupivacaine decreased BR-LGU 15-26% in 35 of 38 structures examined With i.m. bupivacaine, SP-LGU remained unchanged in almost all regions, while BR-LGU was decreased 11-23% in 23 structures. Plasma concns. of bupivacaine in the epidural and i.m. groups were comparable. With spinal cord transection alone, SP-LGU decreased with varying degrees depending on the structure examined, but BR-LGU did not decrease in 36 of 38 structures examined Thus, analgesic doses of epidural bupivacaine decrease SP-LGU, probably reflecting decreased neuronal activity of the spinal cord. Reduced BR-LGU by epidural bupivacaine is most likely due to the drug systemic effect rather than deafferentation.

DOCUMENT TYPE: Journal; General Review
LANGUAGE: English

AB A review with 40 refs. The science of resuscitation has advanced considerably during the past 25 yr as a consequence of modern cardiopulmonary resuscitation (CPR). Complete cerebral ischemia for more than 6 min will result in irreversible brain damage in human subjects. However, recent studies suggest that there may be time-dependent therapeutic measures which could improve the neurol. outcome after CPR. These studies suggest that cerebral ischemia is multifactorial in nature and that Ca^{2+}, Mg^{2+} and Fe^{2+} ions are important in producing the sequential events which take place at a cellular level. Therefore, a variety of specific and nonspecific calcium entry blockers (e.g. nimodipine, lidoflazine and Mg^{2+}), N-methyl-D-aspartate blockers (e.g. MK-801), and an iron-chelating agent (e.g. deferoxamine) may prove useful as therapeutic agents.

AB The possibility of association between changes in spinal cord glucose metabolism and changes in spinal cord neuronal activity caused by injection of morphine into the epidural space, in amts. adequate to produce analgesia, was examined in rats. Apparently, analgesic doses of epidural morphine do not affect neuronal activity of the spinal cord by changing spinal cord carbohydrate metabolism

AB The effects of sciatic nerve stimulation on the EEG, cerebral metabolic rate for O (CMRO2), and cerebral blood flow (CBF) were investigated during thiopentone [76-75-5] anesthesia in dogs. Anesthetic levels at 15, 35, 65, 95 and 125 min after the start of thiopentone infusion (23 mg/kg·h) were designated levels I, II, III, IV and V of anesthesia, resp. The effects of stimulation for 5 min were tested at each level. At level I (plasma thiopentone concentration; 15 μg/mL), the EEG was activated with stimulation and CMRO2 and CBF increased by a maximum of 16 and 15%, resp. The increase in CMRO2 and CBF was significant for 5 and 4 min, resp., though the increase became less with time. At level II (27 μg/mL), the CMRO2 and CBF increased at 1 min by 8 and 9%, the increase being accompanied by transient EEG activation. At the 3 deepest levels III, IV and V (37, 42, 49 μg/mL), the EEG, CMRO2 and CBF remained unchanged with stimulation. The results suggest the existence of the tight coupling between the EEG, CMRO2, and CBF and of a threshold level of thiopentone to block the response to peripheral stimulation during thiopentone anesthesia.

I

AB The effects of i.v. diazepam (I) [439-14-5] (0.2 mg/kg) on the evoked electrospinogram, recorded with an epidural electrode in the posterior epidural space of the lumbar enlargement, and on the evoked electromyogram, recorded with disc electrodes on the gastrocnemius muscle, were studied following posterior tibial nerve stimulation in normal subjects. The amplitude of P1, a reflection of afferent input through the dorsal root, was

depressed 3 min after administration of I. The amplitude of P2 of the electrospinogram, a reflection of primary afferent depolarization in the spinal cord, was increased 10-30 min after injection. The amplitude of the H-reflex of the evoked electromyogram decreased 3-30 min after injection, whereas that of the M-wave remained unchanged. These results suggest that I in clin. doses may directly affect the function of the human spinal cord.
